FLIGHT OPERATIONS NOTICE

Number: OPS/N/2023/004

Flight Safety Documents System

Flight Operations Notices are intended to provide advice and guidance to illustrate a means, but not necessarily the only means, of complying with the Regulations, or to explain certain regulatory requirements by providing informative, interpretative and explanatory material. Flight Operations Notices should always be read in conjunction with the relevant regulations.

1. Purpose

This notice provides operators with guidance on the establishment of an effective flight safety documents system for the use and guidance of operational personnel.

2. Applicability

The scope of this notice is to provide guidance on the development and organization of a flight safety documents system.

Operators yet to establish a flight safety documents system should utilize the information contained in this notice when establishing such a system. Operators with established flight safety documents system should verify that the functionality of their system is in compliance with the concepts outlined in this notice.

Authority inspectors will be conducting a review of respective flight safety documents system to ensure their effectiveness in providing vital safety information to flight crew in a timely manner.

3. References

- ICAO Doc 9683 Human Factors Training Manual

4. Additional Information/Clarification/Queries

Any queries, requests for guidance/clarification or additional information subsequent to this publication should be addressed to General Manager Safety and Security Regulations by mail dalabrosse@scaa.sc or by contacting the SCAA Safety and Security Regulations Flight Operations and Personnel Licencing Inspectorate (telephone **4384271**)

5. Effective Date

31 August 2023

6. Cancellation

This Notice will remain in force until revoked or replaced by the Authority.

7. Flight Safety Documents System

7.1 Definitions

The following definitions are reproduced for ease of reference:

- (a) *Flight Safety Documents System*. A set of inter-related documentation established by the operator, compiling and organizing information necessary for flight and ground operations, and comprising, as minimum, the operations manual and the operator's maintenance control manual.
- (b) *Quality Assurance*. All those planned and systematic actions necessary to provide adequate confidence that a system, component, or facility will perform satisfactorily in service.
- (c) *Safety Management System (SMS)*. A systematic approach to managing safety, including the necessary organisational structures, accountabilities, policies and procedures.

7.2 Background

- 7.2.1 The findings of the ICAO Universal Safety Oversight Audit Program (USOAP) include, among others, deficiencies in compliance with Standards and Recommended Practices (SARPs) regarding operational documents required by Annex 6. These specific findings refer to deficiencies in operations manuals and maintenance control manuals.
- 7.2.2 Analysis of accident information revealed that in accident reports involving international commercial air transport aircraft and in incident reports, deficiencies in operational documents were considered contributing factor to the events.
- 7.2.3 The International Civil Aviation Organization has adopted a Standard in Annex 6, Operations of Aircraft, Parts I and III, requiring that an operator establish a flight safety documents system for the use and guidance of operational personnel as part of its accident prevention and flight safety program.

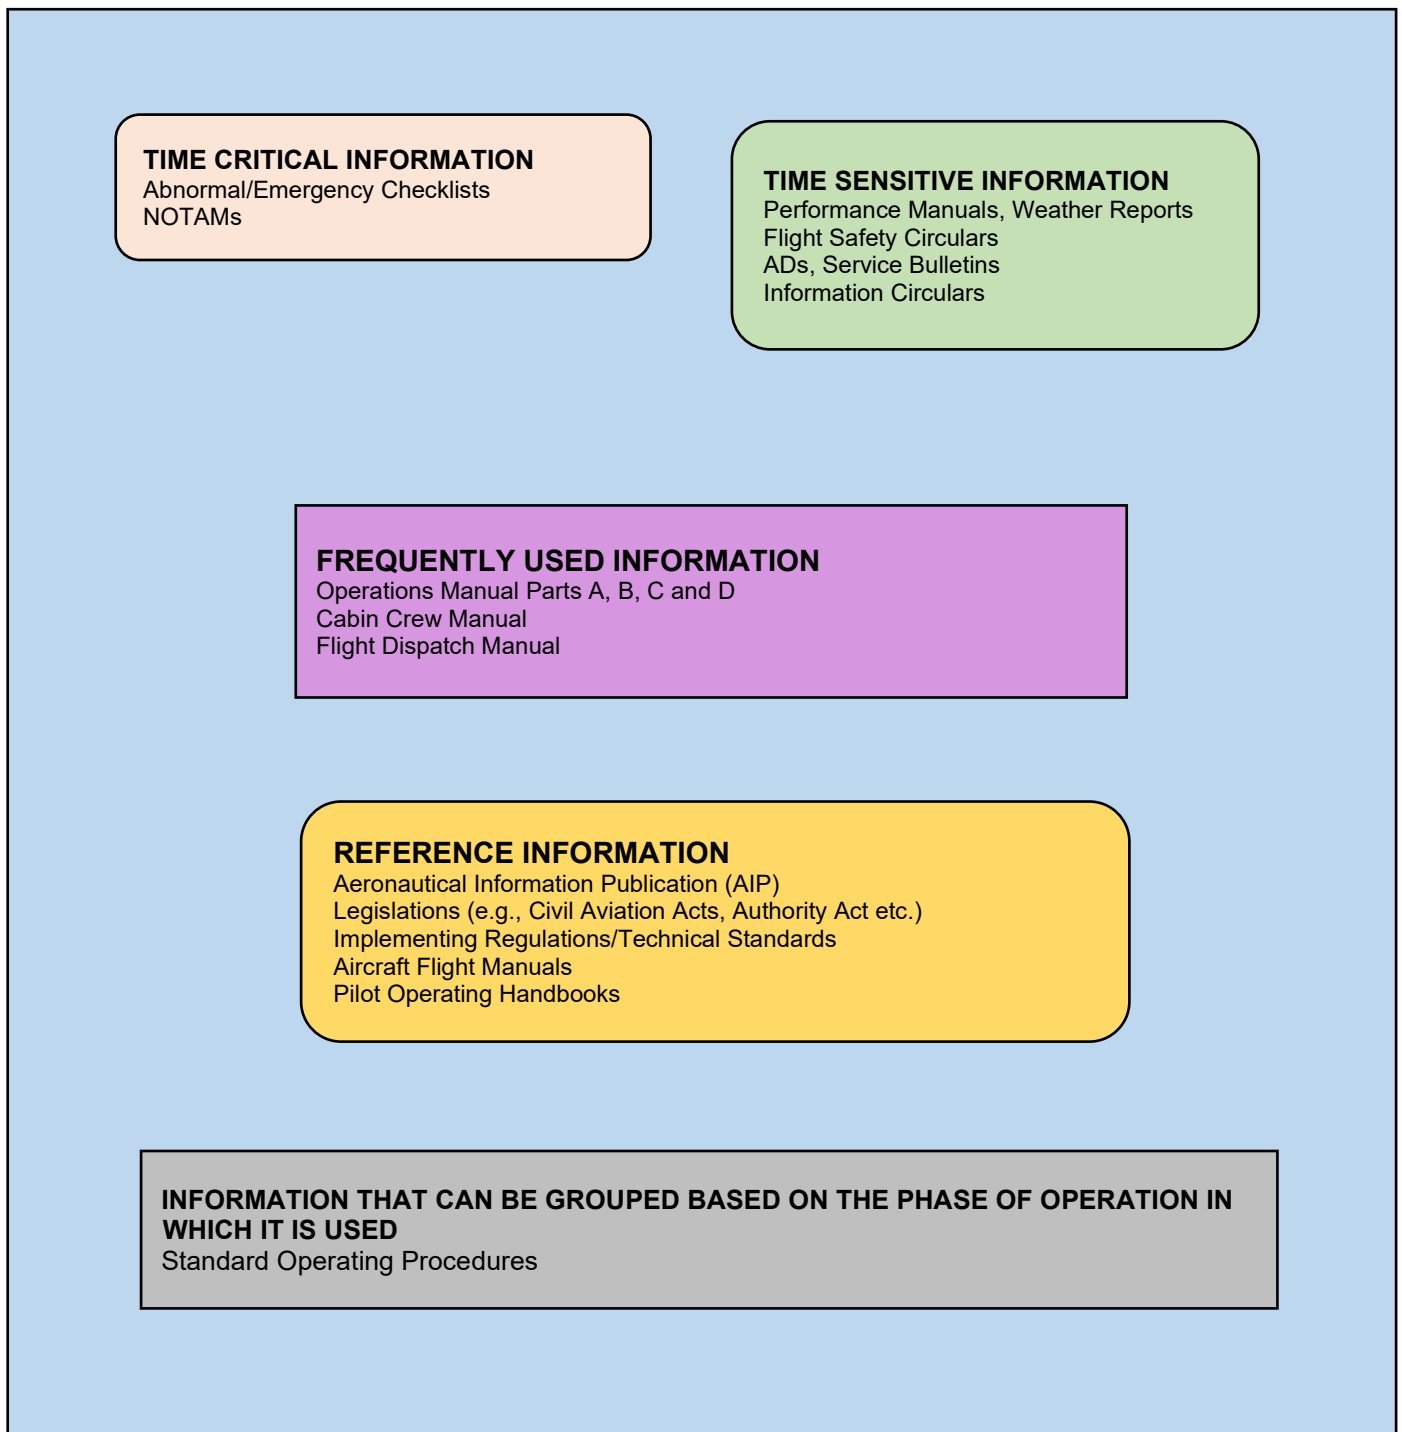

7.3 Flight Safety Documents System Concept

- 7.3.1 It should be understood that the development of a flight safety documents system is a complete process, and that changes to each document comprising the system may affect the entire system. Guidelines applicable to the development of operational documents have been produced by the Authority and are available to operators. Nevertheless, it may be difficult for operators to make the best use of these guidelines, since they are distributed across a number of publications.
- 7.3.2 Furthermore, guidelines applicable to operational documents development tend to focus on a single aspect of documents design, for example, formatting and typography. Guidelines rarely cover the entire process of operational documents development.
- 7.3.3 It is important for operational documents to be consistent with each other, and consistent with regulations, manufacturer requirements and human factors principles. It is also necessary to ensure consistency across departments as well as consistency in application. Hence the emphasis should be placed on an integrated approach, based on the notion of the operational documents as a complete system.
- 7.3.4 The guidelines in this notice address the major aspects of an operator's flight safety documents system development process, with the aim of ensuring compliance with Flight Operations Directive General Requirements for Aeroplane Commercial Air Transport Operations paragraph 7.3.6. The guidelines are based not only upon scientific research, but also upon current best industry practices, with an emphasis on a high degree of operational relevance.

7.4 Organization

- 7.4.1 A flight safety documents system should be organized according to criteria which ensure easy access to information required for flight and ground operations contained in the various operational documents comprising the system and which facilitate management of the distribution and revision of operational documents.
- 7.4.2 Information contained in a flight safety documents system should be grouped according to the importance and use of the information, as follows:
- (a) Time critical information, e.g., information that can jeopardize the safety of the operation if not immediately available;
 - (b) Time sensitive information, e.g., information that can affect the level of safety or delay the operation if not available in a short time period;
 - (c) Frequently used information;
 - (d) Reference information, e.g., information that is required for the operation but does not fall under (b) or (c) above; and
 - (e) Information that can be grouped based on the phase of operation in which it is used.
- 7.4.3 Time critical information should be placed early and prominently in the flight safety documents system.
- 7.4.4 Time critical information, time sensitive information, and frequently used information should be placed in quick-reference guides.
- 7.4.5 The flight safety documents system should be validated before deployment, under realistic conditions. Validation should involve the critical aspects of the information use, in order to verify its effectiveness. Interactions among all groups that can occur during operations should also be included in the validation process.
- 7.4.6 A flight safety documents system should maintain consistency in terminology and in the use of standard terms for common items and actions.
- 7.4.7 Operational documents should include a glossary of terms, acronyms and their standard definition, updated on a regular basis to ensure access to the most recent terminology. All significant terms, acronyms and abbreviations included in the flight documents system should be defined.
- 7.4.8 A flight safety documents system should ensure standardization across document types, including writing style, terminology, use of graphics and symbols, and formatting across documents. This includes a consistent location of specific types of information, consistent use of units of measurement and consistent use of codes.
- 7.4.9 A flight safety document system needs to include a verification mechanism to ensure that, whenever a section of a document is amended, all other documents likely to be affected are identified and that consequential amendments are duly coordinated and agreed to by the responsible departments before the amendment is processed.
